

perennial ryegrass

2M20

THE FOUNDATION OF EXCELLENCE

A research first approach of perfecting turfgrass performance.

Variety information

Description:

2M20 is a dark green perennial ryegrass with good turf quality and quick establishment. It has good resistance to stem rust and can tolerate low rates of glyphosate for an added weed control tool.

Applications:

2M20 can be very useful in the overseeding market and permanent turf where there are problems with poa annua. A rate of 8oz/ acre of glyphosate may be applied under 90 days after planting to reduce or eliminate poa annua. Special conditions may apply such as do not spray within one week of freezing temperatures. Also adequate irrigation should be applied. Please see attached recommendations.

Geographical Adaption:

PST 2M20 is adapted for permanent turf and overseeding of dormant Bermuda around the world. Fertilizer rates typical for a ryegrass after a glyphosate application is helpful to aid in the resistance allowing 2M20 to grow out of the glyphosate effects while the poa dies.
